

AGS ASTRA AI

Astra AI – Feedback Observations

1. Reactive Case Classification

- For reactive cases, Astra AI identifies them as **Maintenance Cases**, which can be misleading and may cause users to follow the wrong workflow. Reactive cases should be classified separately from maintenance cases.

2. Verify Project Details

- Open the project's **Case History**.
- Ensure no open **maintenance case already exists for the issue** you are about to log.

2. Reactive Case Query Response

- When asking for a **Reactive Case** procedure, Astra AI returns the **Ancillary Reactive Procedure** instead of the standard reactive case process. The AI should distinguish between standard reactive cases and ancillary reactive cases and provide the appropriate SOP.

3. Create a New Reactive Case

- Click **New Case** (top-right corner).
- Fill the required fields:
 - Case Record Type:** **Ancillary - Reactive**
 - Priority:** **Medium** (default for ancillary reactive cases)
 - Case Origin:** **Manager Created**
 - Reported Issue:** **Other**

3. SOP Enhancement – Work Order (WO) Type

- Add a clear instruction in the SOP stating that the **Work Order (WO) Type should be set to "Not Applicable"** for all Reactive Cases
 - Primary PM - Preventive Maintenance (PM)
 - Secondary PM - Preventive Maintenance (PM)

4. SAP# Procedure for AES Cases

- Include the complete **SAP procedure for AES cases** in Astra AI so users receive step-by-step guidance for SAP-related activities during AES workflows.

5. Improve SOP Search Accuracy

- Enhance the search logic so that similar keywords (e.g., *Reactive, Ancillary Reactive, Maintenance*) return the correct SOP instead of the closest matching document. This will reduce confusion and improve user experience.

6. Context-Aware SOP Recommendations

- Astra AI should ask for clarification or identify the case type before recommending an SOP when multiple procedures have similar names, ensuring users are directed to the correct process.

Switched to Llama 3.3 70B — GPT-OSS 120B daily limit reached

DSD is mentioned as a type of "Customer Request" under Case Origins, which is one of the categories for case creation.

These improvements will help Astra AI provide more accurate guidance, reduce SOP selection errors, and improve the overall user experience.
